

## Menu entry

For the user to be able to open a module's UI, a menu entry needs to be registered to C1 Core. This is done by passing a menu entry description to `registerModule` or - when using C1 Module Proxy - by specifying `moduleUiMenu` in `/etc/c1-module-proxy/main.conf`. A menu entry description looks like this:

```
{
  "label": {
    "de-DE": "Mein Modul",
    "en-US": "My module"
  },
  "icon": "fontawesome/fa-heartbeat",
  "url": "https://my-module.sensaru.net"
}
```

`label` sets the localized menu entry. `icon` sets the icon before the label. When the user clicks on the menu entry `url` is opened in in iframe.

### Warning

`url` must be a subdomain of `sensaru.net`. Otherwise authentication won't work correctly because of browser Cookie restrictions.
